Type

Scientific Exhibit

Keywords

Interventional non-vascular, Interventional vascular, Radioprotection / Radiation dose, Catheter arteriography, Fluoroscopy, Dosimetry, Quality assurance

Aims and objectives

Present the experience and initial results of an automatic system, recording and processing simultaneously, patient and staff doses during interventional procedures.

Methods and materials

The system receives patient dose information (together with demographic, technical and geometrical data) from the DICOM Radiation Dose Structured Report. In addition, active electronic dosimeters (one at the C-arm and others worn by staff present at the catheterization laboratory) measure the scattered and occupational doses during the procedures transferring wireless this information to a hub receptor, and from there, via intranet, to the automatic dose processing system. The available software is able to show, at the end of the procedure, total patient and occupational dose values per procedure and for all the individual radiation events (cine and fluoroscopy runs). Trigger dose levels for individual procedures and for operators can be set.

The occupational dose (mSv) versus the patient dose (Gy·cm²) for eight interventional cardiologists.

Results

A sample of 1200 interventional cardiology procedures have been audited in 3 catheterization laboratories. Median values of kerma area product (KAP) were 50 Gy·cm². Occupational doses (Hp(10) over the apron) ranged from 10 to 200 µSv per procedure. Operators with occupational doses > 1 µSv/(Gy·cm²) were advised to improve the shielding use. For procedures with KAP >500 Gy·cm², clinical follow-up is considered.

Conclusion

The system allows the automatic detection of abnormal patient or staff doses to initiate corrective actions or clinical follow-up for some patients, but also to verify the correlations between staff and patient doses to alert on the improper use of protection tools as the ceiling suspended screen.

Affirmations

Presentation at The Voice of EPOS: If my abstract is accepted, I agree to present my poster in person at ECR 2017 during a moderated poster session at The Voice of EPOS. I understand that participation is subject to invitation. (Yes)

Poster publication: In order to have my poster published in EPOST™, I herewith submit an abstract of my poster to ESR. If my abstract is accepted by the ESR, I agree to provide the digital material of this poster to EPOST™ within the given deadline. I also understand that my poster will be published in EPOST™ under an open license (where the author/s will keep all copyrights, and readers will be allowed to share and use the poster under certain conditions which will be outlined). (Yes)

Material used: I affirm to the ESR that my abstract, and subsequently my poster, does not contain any material that is libellous, defamatory, or otherwise unlawful, and that
it does not contain any material that invades the right of privacy, any proprietary or copy rights owned by another and has not been previously submitted to EPOSTM. (Yes)

Copyright and licenses: I affirm that I have the right to assign license to my poster. I further affirm that if my poster contains any material that has been previously published, I was entitled to use this material by applicable law or have obtained a transferable license from the copyright holder. (Yes)

Co-Authors agreement: If my poster was produced by co-authors, I, the submitting author, warrant that I was given authorization to represent the other co-authors (co-licensors) as listed in the author line of this abstract. (Yes)

Presenter registration: I understand that full poster material will only be published in the ECR Scientific Exhibition in EPOSTM if the presenting author is registered for ECR 2017. (Yes)
